

GSoC Phase I : First Half
Project : AXIOM Remote - Bootloader
improvement and extension

Priya Pandya

Phase I

Tasks

Task1

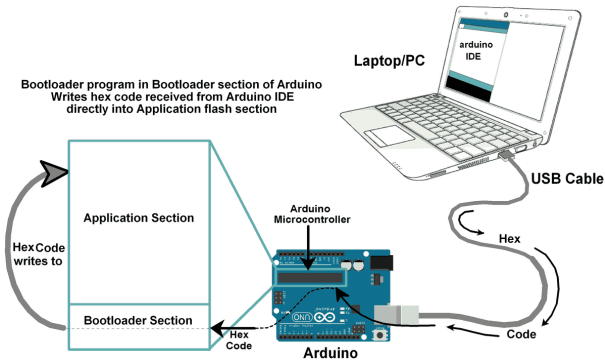

Task2

Plans for upcoming weeks

Phase I

- ▶ Task1: Flashing of firmware on PIC16s using PIC32
- ▶ Task2: PIC32 self-programming

Task1: Flashing of firmware on PIC16s using PIC32 5

- ▶ A python script will be used on the host PC (skeleton is ready)
- ▶ The features are:
 - ▶ It uses pySerial module
 - ▶ Command line arguments for operation, to select chip, to select UART port, to select HEX file
 - ▶ It communicates with the Bootloader using an ASCII based protocol

1 PICKit, 3 PICs? How?

7

- ▶ It replicates the functionality of a PICKit to communicate with the PIC16s (or KMs)
- ▶ It has all the ICSP commands defined there and simple read and write methods

- ▶ To flash the firmware with UI in the PIC32
- ▶ Same python script and the protocol to communicate with the BL will be used

- ▶ This week:
 - ▶ Create commands to read the data from Bootloader
- ▶ If above successful then develop for write also
